MUSCLE UPS

BEGINNER LEVEL

TRAINING PROGRAM

BY ANDRESTATIX

ABOUT THE PROGRAM

The Muscle Up Beginner level program is designed for athletes who initially have a minimum base in bodyweight exercises:
Pull-ups(chin-ups) - 12-15 reps
Dips - 20-25 reps.
It is also recommended to have a good level in the base with extra weight:
Pull-ups and Dips with additional weight equal to about 50% of own weight for 5-6 times. (30-45 kg for 5-6 reps).
A good basic level is required to learn Muscle Up more quickly and without injury.
There are several stages to the full mastery of this movement:

1. Muscle Up Technical Theory
2. Introductory exercises to master Muscle Up
3. Training program for mastering Muscle Up movement and increasing the number of repetitions

In the next advanced level program, there will be different Muscle Up routines as well as Muscle Up programs with additional weights.

INVENTORY

1. Pull-up bar at the height of outstretched arms upwards and Dips bar.
   Magnesia is also desirable.
2. Training loops from thickest to thinnest (set of 4)

BASIC CONCEPTS

BW - Own weight, own weight.
3x8 - Approaches X Repetitions.
Volume - number of sets and reps per training session, week or month
Intensity is the amount of strain you endure while exercising. (load progression)

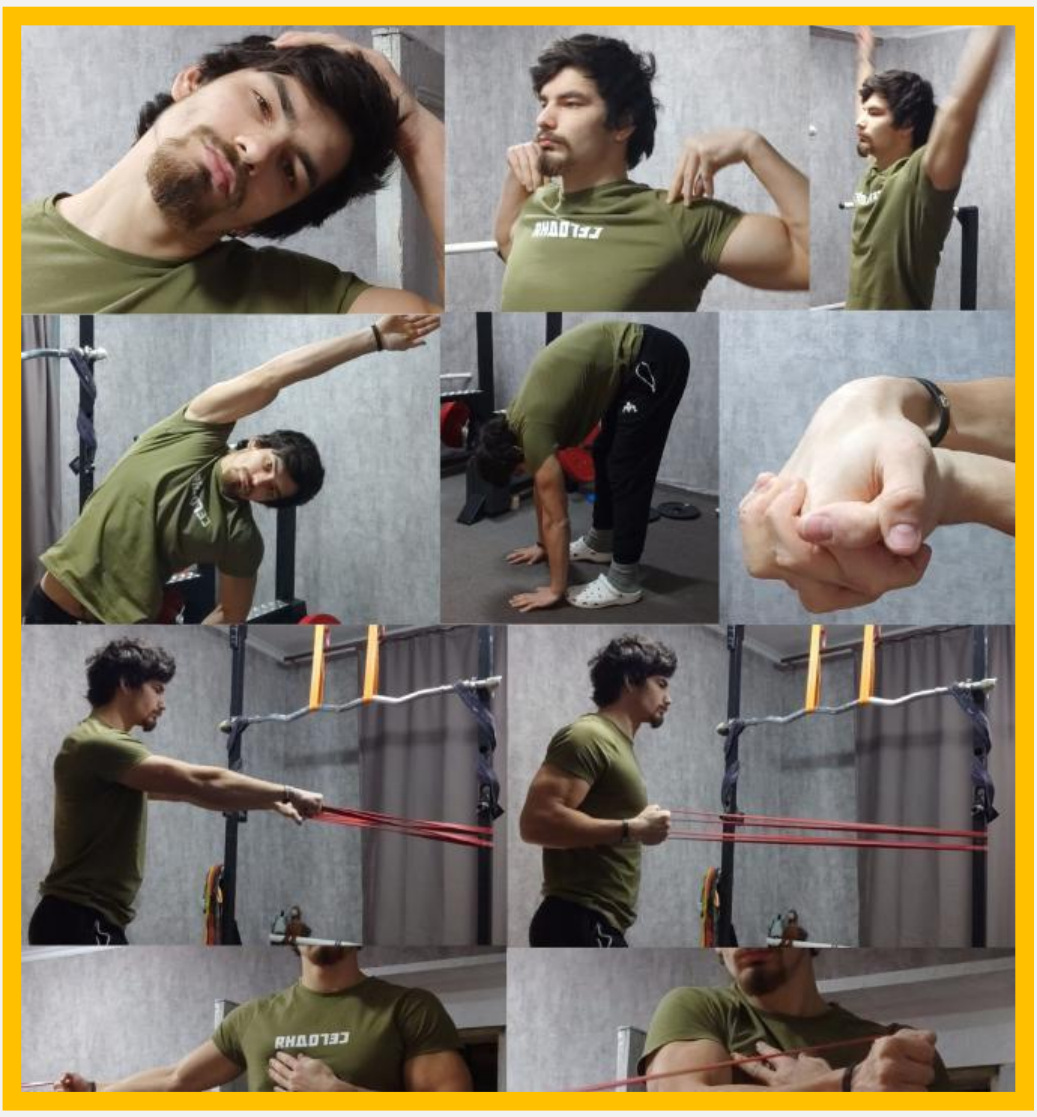
WARM-UP

A proper warm-up will only take 10-15 minutes and is necessary to prepare your body for the work ahead and reduce the chance of injury. The warm-up will be divided into 3 stages:

1. Start your warm-up with 5 minutes of cardio to get your heart rate up. Jumping rope or not, light jogging, running in place or a brisk

walk to the gym. This will warm up your heart.

2. This is followed by a joint warm-up of all body parts, which are the neck, shoulders, elbows, hands, back, pelvis, knees and feet. Ten to fifteen strokes or rotations for each body part.
3. Afterwards, you should do a warm-up before the main pull-up and push-up movements.
   Back pulls and pectoralisers are good for this.
   One to two sets of 10-15 repetitions with an elastic band is sufficient.
   Between all three warm-up phases, rest for 20-40 seconds as you feel comfortable.



TECHNICAL THEORY MUSCLE UP

Before you start learning a new movement, always study the technical aspects of the movement first and only then go straight to the practical part. You can't go into a technically complex exercise without knowing what it's all about. Muscle Up itself is a technically complex multi-joint movement with a transition phase between three separate technique phases:

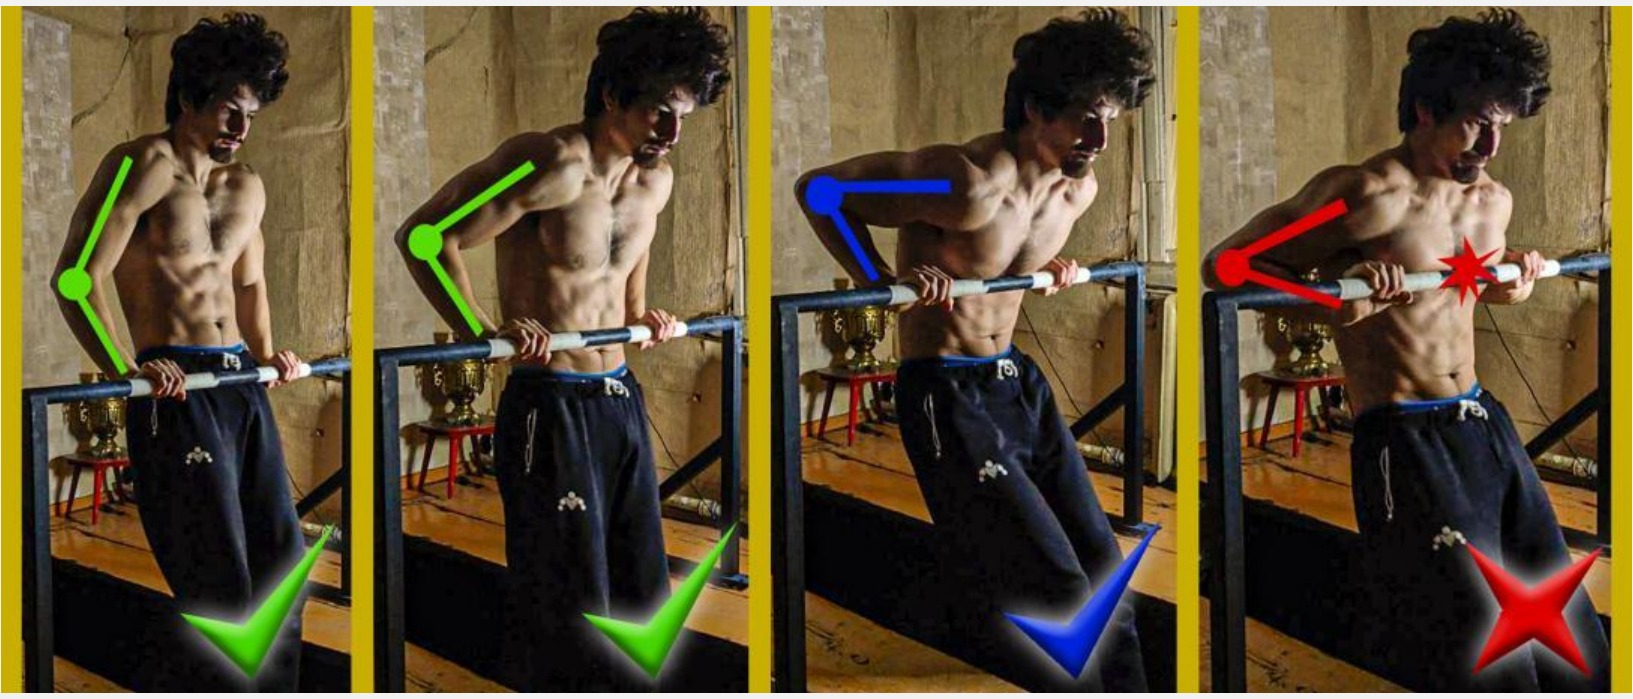
1. Explosive straight-arm pull-up
2. Rounding the bar - the transition phase
3. Push-up on the bar

Each of the phases requires you to have some specific preparation. If something is not fully developed, the overall technique of the exercise will collapse, hence the effectiveness of the performance will be minimal for further development in the movement. The following aspects will be dealt with below:

1. Grip width and depth
2. Swing and trajectory
3. Leg jerks and inertia

First, let's review the high pull-up phase, as this phase is the most important part of the movement. The movement begins with

straight arms and ends in the transition phase from pull-up to push-up.
The speed of your pull-ups depends specifically on your strength in the basic movement on the bar: the higher your 1RM (Maximum kg per 1 rep), the easier and faster you are able to do pull-ups. In Muscle Up, your pull-up should not only be as fast as possible, but also as high as possible: the higher you pull up, the easier it will be for you to do the push-up at the top of the exercise. The minimum you need to be able to pull up to the bottom of your chest, otherwise you simply won't be able to do the Muscle Up. This option will be marked with a blue tick in the picture below:



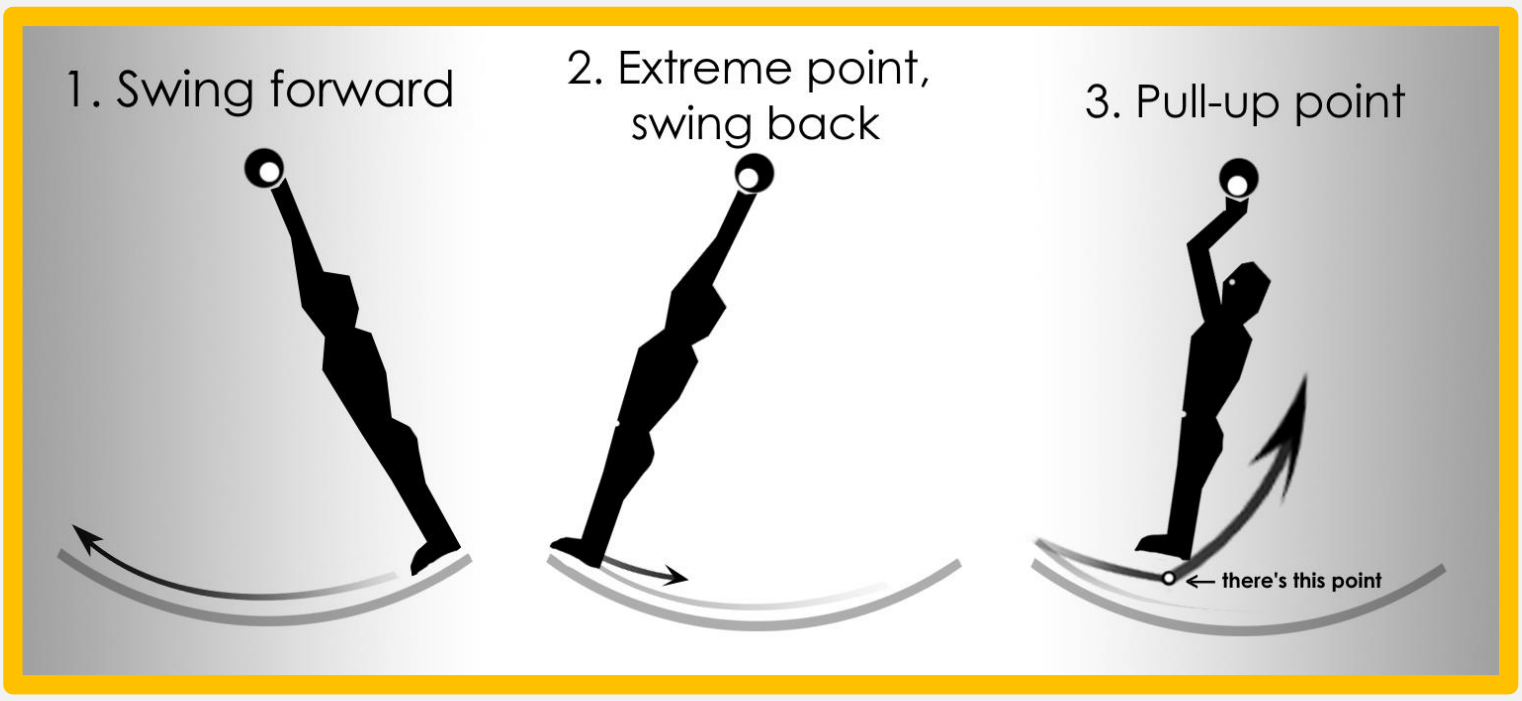
The rightmost option is unacceptable as you simply won't have enough height to overcome the transition phase from the pull-up to the push-up phase.
On the left side of the picture are the most recommended options for easy Muscle Up, indicated by the green check mark.

But there is another feature of Muscle Up performance that is worth paying due attention to, and that is to bring the shoulder blades together and apart during the exercise. Muscle Up differs from pull ups in that in Muscle Up you don't need to bring your shoulder blades together at all, but instead you need to bring them as far apart as possible. The variation on the left:

You should also consider when to start a high pull-up. The point is that at the very beginning of mastering this movement, you

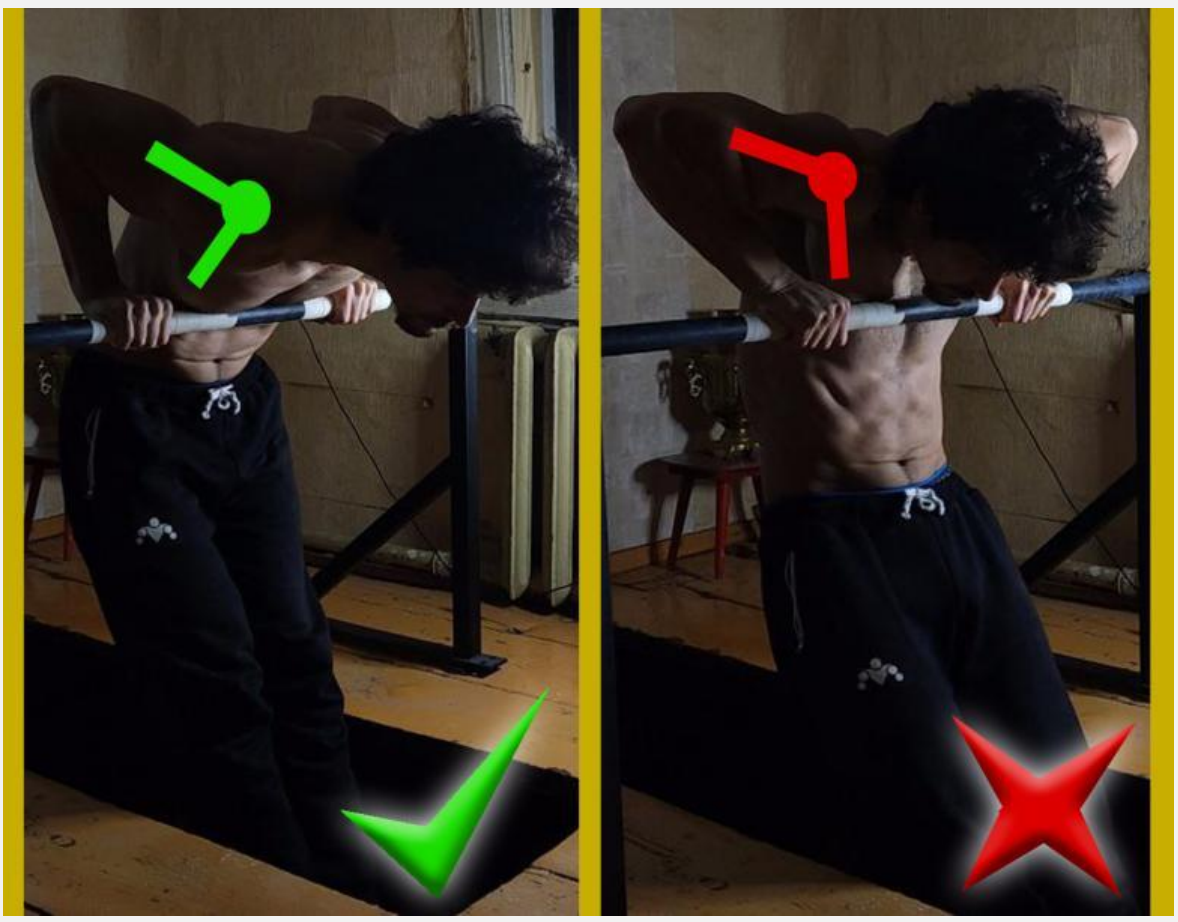
must use such a swing so that you can easily overcome the transition phase from pull-up to push-up by inertia. The trajectory of the Muscle Up goes in an arc around the bar, but if you don't swing properly, you'll crash into the bar and nothing will happen. This is especially important in Muscle Up with extra weight, where you can't do without swinging at all.

Schematically, the moment when you have to pull up when swinging will look like the following:



Start the pull-up at the exact moment shown in point 3. If you start a little earlier or a little later, you will spend more effort than necessary to stay at the top point. Just try it for yourself and see for yourself that this is really the case.

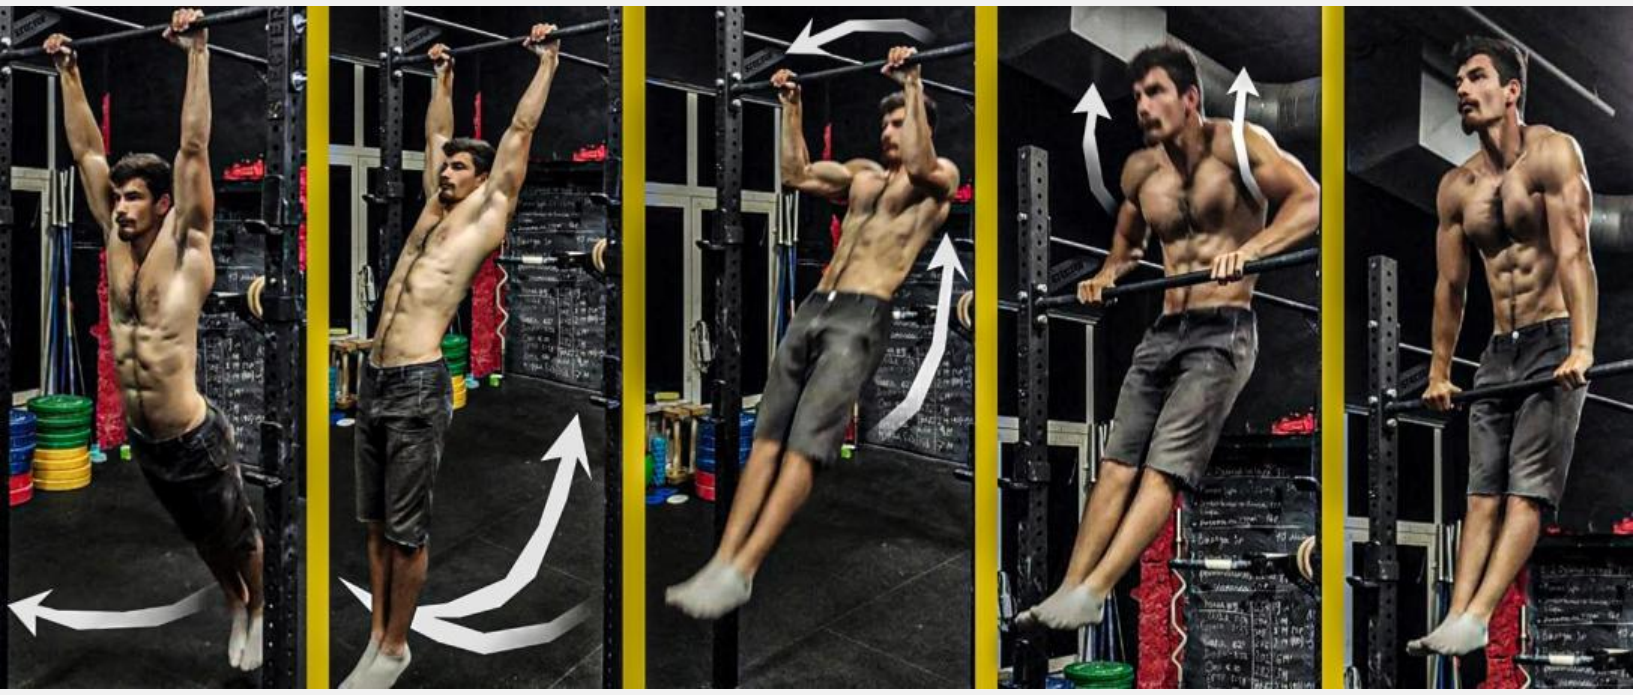
Next, the high pull-up is followed by the transition phase. This phase is almost imperceptible, but it is where most beginners have problems.
The point is that during the high pull-up, you must press your elbows against your body, then throw your chest over the bar to be in the position marked by the green check mark at the top:



Do not just put your elbows over the bar and leave your chest below the bar, this option will be marked in the picture with a red cross. In this variant there is a huge load and stretching of the shoulder girdle, and we don't need it!

After overcoming the transition phase
Followed by the push-up phase in the overhead support.
Here you just have to push off the bar and straighten your elbows to the end. Then the exercise is worthy of being considered completed to the very end!

Live **Muscle Up** will look like this:



Next, let's review the grip with which I recommend doing Muscle Up.
The grip should be as deep as possible, so that when you get past the transition phase, there is as little wrist twisting as possible:

But if you can't get a deep grip, try using magnesia to keep your hands from slipping off the bar.

Also, the grip should be closed, which means you also work with your thumbs like the others:

Using an open grip (pictured right) is extremely unsafe, as your hand can slip off the chinning bar!

At the initial stage the grip width should be slightly wider than the shoulders, we do not need any variation here, especially with the standard grip it is easier to engage all the muscles in the work than with the other grip.

Now let's turn our attention to the lower body. You should maximise your abs and straighten your legs to make the Muscle Up look nice and aesthetically pleasing, especially this way your body won't hang out on the bar like a sausage and you'll be able to control the movement:

What about the jerking? It's simple:
The lower your level in Muscle Up, the harder you can use your jerk feet to perform Muscle Up. Then, with each training session you try to eliminate jerks and unnecessary jerks, doing Muscle Up purely by hand strength, thereby perfecting your technique to perfection!

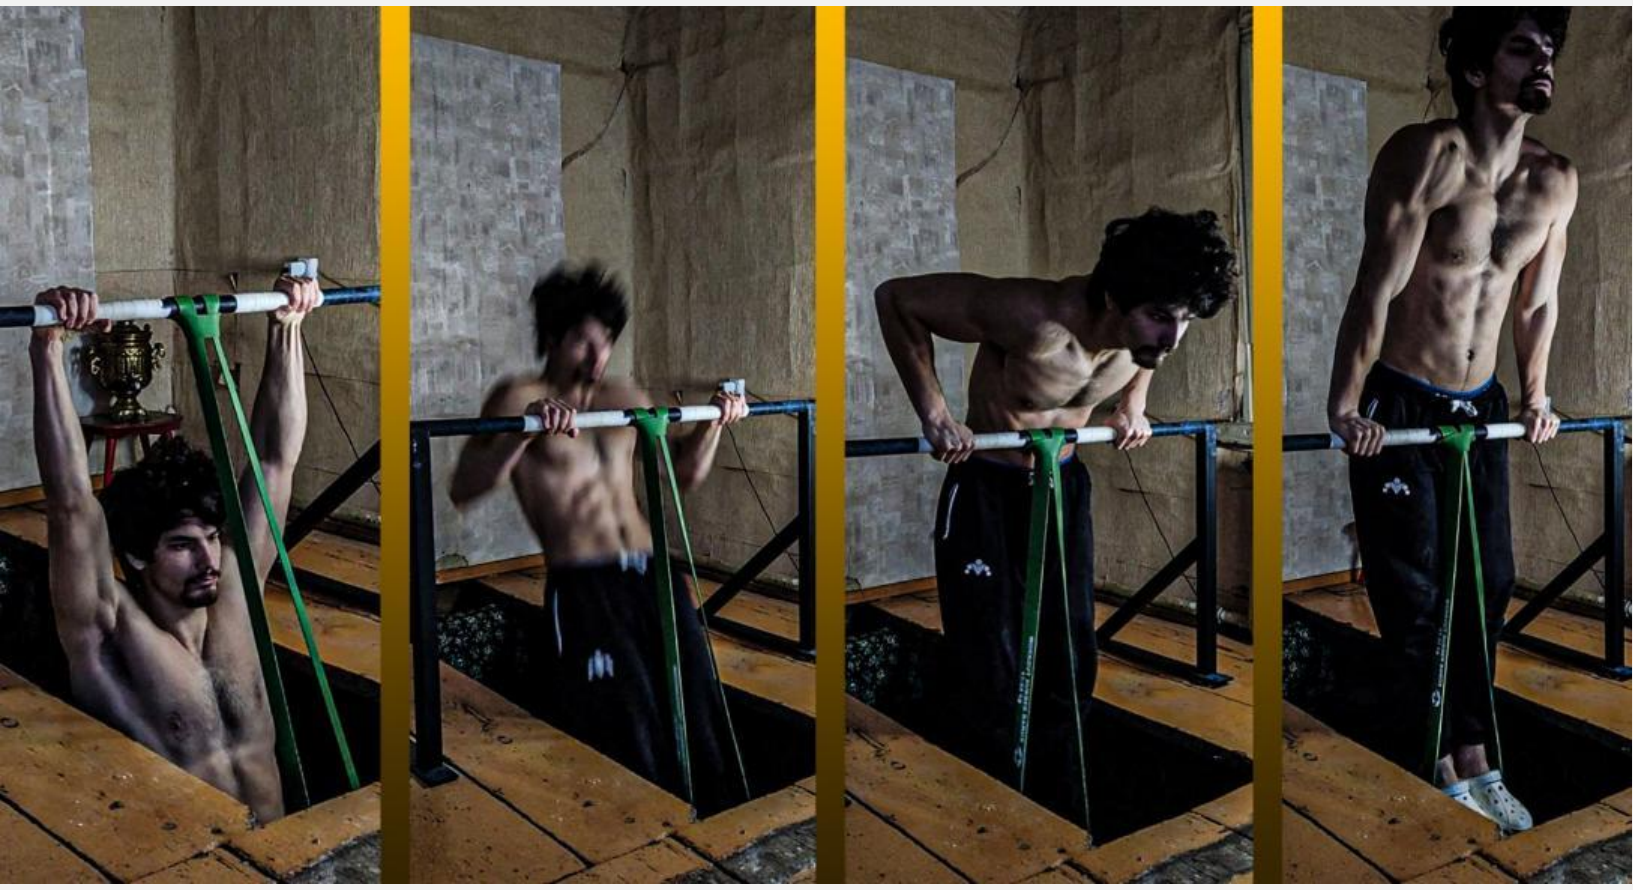
Next, we'll talk about the warm-up exercises for mastering Muscle Up!

INTRODUCTORY EXERCISES TO MASTER MUSCLE UP

For those who know how to 0 reps with BW:

1. **Muscle Up with rubber loops.**

With this method, the easiest way to master the Muscle Up is simply to hang the widest rubber on the bar and try to do the Muscle Up in perfect technique. You can also use load progression here:
Do Muscle Up with the thickest elastic band for several workouts and only after mastering the movement do you change to a thinner (narrower) elastic band. Then, as you progress, you remove the resistance bands altogether and try to progress by increasing the number of repetitions. The training plan will be described below.



2. **From the jump on the low bar.**

You need a low bar and a high jump!
In this method of learning Muscle Up, you simply try to do it with a leg jump. You can increase the load simply by jumping weaker than usual. If you only have a high bar, you can do jumps from a chair or bollard, but be careful and always hold on to the bar! ☺

3. **Negative Muscle Up.**

Slowly descend from the upper point to the lower point. So you do everything in reverse. But here you have to get on the chinning bar at the beginning. This exercise is best done on a low chinning bar.

For those who have learned 1 repetition:

1. **Muscle Up without the push-up phase.**

It's pretty simple. You do Muscle Up, but you don't do a push-up in the upper phase, you just stay in the rest position for 1 second and then simply lower yourself down. With this method you can increase the number of Muscle Ups per set by 1.2 to 1.5 times what you normally do!

2. High pull-ups.

I already wrote about high pull-ups in the previous chapter. Here you can also progress by increasing the height of the pull-ups. With each workout you pull up higher and higher trying to touch the bar with your lower abdomen (pubis).☺

3. Just trying or complete repetition.

Yes, just trying and nothing more. You're just trying to do Muscle Up in good technique. Just... trying....

MUSCLE UP TRAINING PROGRAM AND INCREASING THE NUMBER OF REPETITIONS

Before you start training specifically on the program, you must first learn Muscle Up. As I wrote earlier, you must first have good strength in the basic exercises on the bar, and only after you have achieved a good base do you start to learn Muscle Up. First you need to learn how to do at least 1 Muscle Up. This will be helped by the exercises from the list "For those who can do 0 rep with BW". The training program will last for 2 weeks and should be repeated afterwards, but using a thinner rubber band

Exercise	Mon	Wed	Fri
1 week. Muscle Up with an elastic band	3x2	3x3	3x4
From a low jump the turnstile	3x2	4x2	5x2
Negative Muscle Up	2x3	2x4	2x5
2 week Muscle Up with an elastic band	3x5	2x3	**BW** 1xMAX
From a low jump the turnstile	3x3	2x3	5x3
Negative Muscle Up	3x3	3x4	3x5

In this program, the number of repetitions and the number of sets are increased with each training session. On the very last workout of this 2-week cycle, instead of Muscle Up with a rubber, you do **1 MAXIMUM CO BW!**
This is a test of your abilities after working with a rubber band. Next, in the second 2-week cycle, you train with a thinner rubber. And also at the end of the cycle you check your maximum with BW. If you learned to do 2-4 repetitions with BW, you can safely quit this program and move on to the next one.
The next program will focus on increasing the number of reps with BW. But you can also use rubber loops to make Muscle Up easier. At the end of the cycle change the rubber to a thinner one.

Exercise	Mon	Wed	Fri
1 week Muscle Up	3x1	3x2	3x3
Muscle Up without push-ups	3x1	3x2	3x3
High pull-ups	2x2	2x3	2x4
2 week Muscle Up	3x4	3x5	**BW** 1xMAX
Muscle Up without push-ups	2x4	2x5	2x6
High pull-ups	3x3	3x4	3x5

Both programs can be inserted into the main Streetlifting programs or into any of your workouts. I would also like to say that these programs should be inserted specifically on main training days and performed after the main plan, i.e. after the base or elements.
Muscle Up training on rest days is highly discouraged as you will simply slow down your recovery before the next hard workout.

If you have learned to do 6-7 Muscle Up in 1 attempt, your next goal is to do 10-12 Muscle Up in an attempt. To do this, you can use the following program to increase your Muscle Up:

Exercise	Mon	Wed	Fri
1 week Muscle Up	3x3	4x4	5x5
High pull-ups	3x3	3x4	3x5
2 week Muscle Up	3x6	2x4	**BW** 1xMAX
High pull-ups	3x6	1x4	2x3

The higher your level, the more reps you can add to the cycle.

In the next cycle, you increase the number of reps for all exercises and sets by 1 reps, but you do not change the number of sets themselves. That is, with each cycle you do 1 more repetition in all sets. This method will work well if in addition to power outputs you are also progressing in basic movements.

Bottom line: With this program, you can learn Muscle Up in 2 to 3 workouts, and you can increase the number of repetitions in one set from 10 to 15 in a few months of Muscle Up training. You've learned the ins and outs of Muscle Up, and now you have a plan that will help you achieve the results you need to amaze your workout buddies! But that's not the coolest thing you can do! Later on, as your Muscle Up progresses, you can combine your grip, do Muscle Up on other equipment, as well as start training for strength using additional weights! This will be helped by my next **Advanced** Level program where I will go into detail on how to train correctly and effectively further! ☺

F.A.Q - ANSWERS TO QUESTIONS

1. **How long will it take to train on this program? How long will it take me to learn Muscle Us?**

Everyone will have a different length of time to master Muscle Up, it all depends on genetics, age, recovery between workouts. It also depends on how hard you train!

2. **What results can be expected from this program?**

Muscle Up with BW 3x10 or **1x15**!
Muscle Up +10kg for 3-5 repetitions
Learn Muscle Up on the rings
Learn Muscle Up on the dips bar
Learn Muscle Up on any surface
You will become the epitome of Muscle Up!!!

3. **How much rest do I need between each approach?**

3 to 5 minutes, but after heavy sets you can rest for up to 8 minutes. Rest for as long as you need, take your time!

4. **Will I increase my pull-ups or push-ups if I add Muscle Up to my core Streetlifting workout?**

Muscle Up does not directly affect pull-ups or push-ups, but it does add a skill such as speed. That is, the speed to perform basic movements can increase.

STRETCH

We don't need a bunch of variations to stretch in, just the one below:

1. Hang on the bar with both hands or on one hand, depending on your level. (Stretches the back muscles, abs, pecs)
2. Holding the bottom position on the dips in full sag. (stretches pecs, triceps, shoulder girdle)
3. Reverse hanging on the bar.
4. Plank on straight arms with a bend, touching the floor with your belly. (Stretches the front part of the body, i.e. the abs)

Do 2-3 approaches of 40-60 seconds at the end of your workout.

NOURITION AND SLEEP

There are some basic principles of recovery from training! Eat right and get a good night's sleep and your progress will take off like a bird in the sky! To be more specific, it is a good idea to start by adjusting your diet, i.e. removing rubbish from your diet: cakes, biscuits, sodas, Snickers bars, sweets, chocolate bars and so on. You can eat these things, but preferably very rarely. Next, you need to get rid of bad habits, stop drinking alcoholic beverages and smoking cigarettes.

Firstly - it will slow down your progress in training, and secondly - it will be even more detrimental when combined with training

Between workouts you should give your body as much nutrition as possible, eating plenty of slow and fast carbohydrates as well as proteins and fats. Fast carbohydrates include fruit like apples and bananas, dried fruit like sultanas and dates, or confectionery like marshmallows, marshmallows or marmalade. Slow carbohydrates include pasta, oatmeal, rice, buckwheat, millet and similar cereals. A protein-fat meal is desirable after training. Any whole meat or meat cutlets, eggs and pulses in the form of peas are suitable for this purpose. Butter and nuts can also be consumed as sources of fat. The most important thing in your diet is to completely avoid combining proteins and fats with carbohydrates, i.e. to follow the Separate Diet Principle, especially I do not recommend combining fats and carbohydrates. This is done in order to eat much more than usual to increase your daily calorie intake. Protein and carbohydrates should also be eaten separately, so that proteins

can be digested quickly and without putrefaction. Protein is best combined with fibre, vegetables will serve them. I strongly recommend separating meals and a calorie deficit to athletes who are overweight. Also, train hard, increase your daily activity and look in the mirror more often, as the scales do not give you complete information on your body composition. (Body recomposition is the simultaneous burning of fat and gaining muscle mass). Do at least 10k steps a day, get a good night's sleep and don't eat your stress with crap.

I won't tell you anything new about **sleep** either:

1. A minimum of eight to nine hours of sleep.
2. Ventilate the room before going to bed.
3. Sleep in complete darkness and silence.
4. Don't eat or drink an hour before bedtime.
5. Turn off all gadgets and lights at home one hour before bedtime.
6. Improve the place where you sleep: buy a more comfortable pillow and mattress.
7. Don't set a loud alarm clock so that your body doesn't get stressed. It is better to wake up without an alarm clock at all.

Thank you for purchasing this program! I hope that you will start your training with this program, as I used a similar method of progression with rubber myself a long time ago. The load in this program is optimal, you can adjust it to your needs.
Good training and progress!

Regards, your mentor Andrei Pakin
