TABLE OF LEVELS

Level	Approximate level data
Zero	▪ PullUps BW 0-5 reps ▪ Push-ups BW 0-10 reps
Beginner	▪ Pullups BW 12-15 reps or +20-40kgx1 ▪ Push-ups 20-25 reps with +15kg ▪ Dip 30-50kg x1 rep ▪ Muscle Up BW x1-3
Medium	▪ PullUp 40-70kg x1 ▪ Dip 50-100kg x1 ▪ Muscle Up 10-20kg x1
Advanced	▪ PullUp 70-100kg x1 ▪ Dip 100-150kg x1 ▪ Muscle Up 20-40kg x1
Ultra-advanced	▪ PullUp 100-120kg and abovex1 ▪ Dip 150-195kg and above x1 ▪ Muscle Up 40-70kg and more

This table may have nothing to do with objectivereality. For some people these standards may be overstated and for others are underestimated. Even official strength sportsfederations can issue subjective norms.

ABOUT THE PROGRAM

This program is designed for **beginners** who are just starting their training with additional weights. After going through a certain stage of training from scratch to you can put extra weight on yourself straight away when training with your own weight.Progress will be steady, and most of all most importantly as quickly as possible in a short period of time. This program uses a linear periodisation, inwhich progress will be made smoothly from training to training. The program will be divided into threephases:

1. Light phase
2. Middle phase
3. Complicated phase

Each of the phases differs in degree ofdifficulty, going from easy to the intermediate phase will occur when the firstphase is completely exhausted and it is impossible to progress through it. Likewise, from medium to difficult.

INVENTORY

1. Bar for Pullup and Bar for Dip (bars for dip 5-10 cm wider than shoulders)
2. Additional weighting in the form of thinweights for entry level minimum 60kg: 15kg - 2 pcs. and 10kg - 2 pcs. and small pancakes 5kg, 2.5kg, 1.25kgand 0.5kg - 2 pcs. each. If there are no pancakes, at least use kettlebells, but with them it will be less comfortable to study.
3. Belt, carabiners and rope (or chain) tohang extras on weight bearing.
4. We also need practice rubber loops, here Irecommend getting a set of 4 from the thinnest to thick.

BASIC CONCEPTS

BW - Bodyweight, own weight (pull-ups with bodyweight).

3x6 - Approaches X Repetitions

The reserve - is the number of repetitions you couldstill do after made a plan approach. Determined by how you feel. For example, if you have done **6** repetitions but feel that you would **2** more repetitions, then the reserve will be **2** repetitions.

Volume - is the number of sets and reps per workout, week or month

Intensity - is the load you endure during the exercise. (addingextra weight, making exercises more difficult, increasing speed of execution)

Unloading - is the reduction of the working weight by 5-10 kg. Necessary when progression has set in.

WARM-UP

A good warm-up takes only 10-15 minutes and is necessary to prepare your body for thework ahead and to reduce the likelihood of injury. The warm-up will be divided into 3 stages:

1. At the beginning of the warm-up, perform 5 minutes of cardio to get your heart rate up. Jumping rope or not, light jogging, running inplace or a brisk walk to the gym. This will be awarm-up for your heart.

2. This is followed by a joint warm-up of all parts of the body, which are the neck, shoulders,elbows and hands,

   back, pelvis, knees and feet. 10-15 strokes orrotations for each part of the body.
3. Afterwards, you should do a warm-upbefore the main pull-up and push-up movements.
   Back pulls and pectoralisers are good for this.One to two sets of 10-15 repetitions with anelastic band is sufficient.
   Between all three warm-up phases
   Rest for 20-40 seconds according to how you feel.

PROGRAMME - THREE PHASES

1. Light phase

In the light phase of the **entry** level, all training is the same, 3 sets of 6-8 repetitions with one rest day between each.

If you are a trained athlete, it is best to choosethat initial

Weight at which you can easily do 12 repetitions, but if you have moved from **zero** to **entry** level, just start with an extraweight of +2.5kg.

The Program will look like this:

Exercise	Mon	Wed	Fri
Pull-Ups	3 sets 6-8 repetitions	3 sets 6-8 repetitions	3 sets 6-8 repetitions
Dips	3 sets 6-8 repetitions	3 sets 6-8 repetitions	3 sets 6-8 repetitions

LOAD PROGRESSION

Repetitions	8	8	7	7	6	6
Stock	1-2	0	1	0	1	0
How add	2.5	1.25	1.25	0.5 -0.75	0.5 -0.75	Unload 5-10 kg

The program is as simple as possible. Weight to be put on the next training session will depend on the reserve in the last approach of the previous workout.

Regardless of the result of your previous training, you should still put weight on the next workout, even if it is 0.5-0.75kg, but train with the same weight onthe next workout would be extremely unhelpful.

It would be uncomfortable to put on 0.5kg twice in a row, so the second time is betterto put on 0.75kg. The total will be 1.25kg.

You don't have to do all sets on refusal, because the number of reps you want to train with can be different, if you want to do 7 reps with two to spare, then please train the way you want. If 6 reps each, that's fine too. But it's best to start with 8 reps and

Do some 3x8 workouts, no less. Thisnumber of reps Good for muscle mass growth and technique training. We don't need more than 8 repetitions either, as this is already It will be a move away from strength training, and it is important for us to buildstrength.

An example of your progress in the easyphase would be the table below:

MONDAY	**WEDNESDAY**	**FRIDAY**
PullUps +10kg 3x8 Dips +15kg 3x8	PullUps +12.5kg 3x8 Dips +17.5kg 3x8	PullUps +15kg 3x8 Dips +20kg 3x8
MONDAY	**WED** +0.5kg	**FRIDAY** +0.75kg
PullUps +17.5kg 7-7-8 Dips +22.5 8-7-5	PullUps +18kg 8-8-7 Dips +23kg 8-8-7	PullUps +18.75kg 3x8 Dips +23.75kg 3x8

When training is extremely hard and going even 6repetitions is difficult, you need to do an unload, i.e.
reduce the working weight by 5-10 kg and continuetraining 8 reps each, but with a little less weight. You can do 2-3 such reloads during thewhole light phase, but it is better to make the most out of it and
do more unloading!

2. Middle phase

Gradually the first phase will exhaust itselfand add weight on
every training session will be almost impossible and even unloading won't help.It would then be possible to incorporate include light training.

It is best to start the middle phase after an last unloading of 5-10kg on the light phase to make it much easier to start progressing through the middle phase.

The program for the middlephase will look as follows

Exercise	Monday (heavy)	Wednesd (heavy)	Friday (light)
Pull-Ups	3 sets 6-8 repetitions	3 sets 6-8 repetitions	2 sets 5 Repetitions (reserve 2-3)
Dips	3 sets 6-8 repetitions	3 sets 6-8 repetitions	2 sets 5 repetitions (reserve 2-3)

Now instead of three hard training sessions there will be two heavy ones on Mon and Wed withone light one after that on Fri, so your weights will start to rise steadily again from training to training, but less often than usual.

The higher the level, the less frequent the load progression will be, but this will only be better.

The weight to be taken on a lightweight
The workout will be 60-70% of the working weights in the heavy workout. For example, if the working weight is 70kg, it will be 50kg on a light workout.

The progression of loads on the light training sessions is separate. It will depend on the sumof the gains on the previous two hard training sessions. If you put on +2.5kg and +1.25kg each, for example, you put on +3.75kg onthe easy one.

An example of your progress in the middle phase will be served by the table below:

MOND (heavy)	**WEDNESD (light)**	**FRIDAY (heavy)**
PullUps +30kg 3x8 Dips +40kg 3x8	PullUps +20kg 2x5 Dips +30kg 2x5	PullUps(+2.5kg) +32.5kg 3x8 Dips (+2.5kg) +42.5kg 3x8
MOND (heavy)	**WEDNESD (light)**	**FRIDAY (heavy)**
PullUps (+1.25kg) +33.75kg 3x8 Dips (+2.5kg) +45kg 3x8	PullUps (+3.75kg) +23.75kg 2x5 Dips (+5kg) 35kg 2x5	PullUps +36.25kg 3x8 Dips +46.25kg 3x8

3. Severe phase

Now it's time to take your training to the nextlevel! With each
The weights get heavier and heavier withtraining and add to them each time training will be an almost impossible task.
This is where we will start adding weightsnot every workout, but once a week, i.e. once every 2 workouts.
The scheme would be as follows:

Exercise	Mon(heavy)	Wed(light)	Fri(volume)
Pull-ups	3 sets 6-8 repetitions	(pauses) 2 sets 3-5 repetitions	(+weight) 5 sets 4-6 repetitions
Dips	3 sets 6-8 repetitions	(pauses) 2 sets 3-5 repetitions	(+weight) 5 sets 4-6 repetitions

Now the second hard workout on Friday will be even harder, because instead of 3 sets,there will be 5 sets, but the number of repetitions in the range of 4 to 6! This workout will be called a volumetric workout.

Progression of the scales will be less frequent, you now only need to add weight once a weekin a volume training session at Depending on the reserve in the last approach on Monday. Whereas previously 1cycle lasted only one workout, now 1 cycle lasts a week, i.e. 2 workouts.

There will also be a light training session Pauses are included, for example on the baryou can pause at the top point, and on the bars at the bottom point. With pauses the load will be higher, so the range of reps is reduced from 5 to 3-5, and how many to do specifically is your choice. The weight on these workouts is also 60-70% of the working weights, no more!

The weight progression on the easy workout remains the same, increasing the weight on itfollows from how much you put on on Monday.

An example of your progress in the heavy phase will be served by the tablebelow:

MOND (heavy)	WEDNESD (light)	FRIDAY(volume)
PullUps +41.25kg 3x8 Dips +57.5kg 3x8	PullUps paused (+1.25kg) +28.75kg 2x5 Dips (+2.5kg) +40kg 2x5	PullUps(+1.25kg) +42.5kg 5x6 Dips (+2.5kg) +60kg 5x6
MOND (heavy)	**WEDNESD (light)**	**FRIDAY(volume)**
Chinning bar +42.5kg 3x8 Dips +60kg 8-8-7	PullUps paused (+1.25kg) +30kg 2x5 Dips (+2.5kg) +42.5kg 2x5	PullUps(+1.25kg) +43.75kg 5x6 Dips (+1.25kg) +61.25kg 5x6

Switching to each of the phases will prolong your progress for months to come. It all dependson how responsibly you train, eat well and get enough sleep.

When training becomes unbearable and any ofthe phases have exhausted their potential, then
do a 5-10kg unloading and start the progressionall over again. But soon the unloading will no longer help either.

If this is the case, it is worth switching to a programme **medium** level!

F.A.Q - ANSWERS TO QUESTIONS

1. How much training for each of the phases?

As much as you can squeeze out of them! Everyonewill have a different length, it all depends on genetics, age, recoverybetween training

2. What results can be expected from this program?

Doing it right will definitely surprise you with the results, but roughly speaking:
Pull-Ups: 30 to 40kg for 6-8 times or more!
Dips: 40 to 60kg for 6-8 times and up!

3. How much rest do I need between each approach?

4 to 6 minutes, but you can rest for up to 10minutes after heavy sets. Rest as long as you need, take your time!

4. What exercises can be added to the program?

Only exercises for the abs.
Be careful with the squat, it will slow down yourprogress on the bar and parallel bars

5. How many pull-ups and dips will I do without weight with this program?

The number of repetitions will definitely increase in 1.5 to 2 times, maybe more! Pull-Ups 20 to 30 repetitions, Dips 40 to 60.

DISTANCE

We don't need a bunch of variations to stretchin, just the one below:

1. Hang on the bar with both hands or on one hand, depending on your level.
   (Stretches the back muscles, abs, pecs)
2. Hold the bottom position on the uneven bars at full stretch.
   (stretchespecs, triceps, shoulder, girdle)
3. Reverse hanging on the bar.
4. Plank on straight arms with a bend,touching the floor with your belly. (Stretches the front part of the body,
   i.e. the abs)

Do 2-3 approaches of 40-60 seconds at the end of your workout.

NOURISHMENT AND SLEEP

There are some basic principles of recovery from training! Eat right and get a good night's sleep and your progress will take off like a bird in the sky! To be more specific, it is a good idea to start by adjusting your diet, i.e. removing rubbish from yourdiet: cakes, biscuits, sodas, Snickers bars, sweets, chocolate bars and so on. You can eat these things,but preferably very rarely. The next thing to do is toget rid of bad habits, stop using
alcoholic drinks and smoking cigarettes. Firstly - it will slow down your progress in training, and secondly, it will be even more detrimental when combined with training Between training sessions, you need to givenutrition
your body as much as possible, eating lots of slowand fast carbohydrates as well as protein and fats. Fast carbohydrates include fruit such as apples and bananas, dried fruit such as sultanas and dates, or confectionery such as marshmallows,marshmallows or marmalade. Slow carbohydrates include pasta, oatmeal and rice,
buckwheat, millet and similar cereals. After A protein-fat meal is desirable. Any whole meat ormeat cutlets, eggs and pulses in the form of peas. Butter and nuts can be eaten along with this, these will be sources of fats. The most important thing in your diet is to avoidcombining proteins and
fat with carbohydrates, i.e. eating a separate diet,especially I don't recommend

combine fats and carbohydrates. This is done inorder to eat much more than usual
to increase your daily calorie intake. Protein and carbohydrates should also be eaten separately, so thatproteins can be digested quickly and without putrefaction. Protein is best combined with fibre; vegetables will serve this purpose.
I highly recommend a split diet and calorie deficit for athletes who are overweight. Also, to train hard, increase your daily activity and work out more often.look specifically in the mirror, as the scale does
not give you full information on your
body recomposition. (Body recomposition is the simultaneous burning of fat and gaining
muscle mass). Do at least 10k steps a day, get agood night's sleep and don't eat your stress withcrap.

I won't tell you anything new about **sleep** either:

1. A minimum of eight to nine hours of sleep.
2. Ventilate the room before going to bed.
3. Sleep in complete darkness and silence.
4. Don't eat or drink an hour before bedtime.
5. Turn off all gadgets and lights at home onehour before bedtime.
6. Improve the place where you sleep: buy amore comfortable pillow and mattress.
7. Don't set a loud alarm clock to the body is not under stress. It is better to wakeup without an alarm clock at all.

Thank you for purchasing this program!

I hope you will start your training journey withthis program, as I used a similar progression method with rubber myself a long time ago. The load in this program is the most optimal, you can adjust yourself
it to your liking.
Good training and progress!

Regards, your mentor Andrei Pakin
