LEVEL CHART

Level	Approximate level data
Zero	▪ PullUps BW 0-5 reps ▪ Push-ups BW 0-10 reps
Beginner	▪ Pullups BW 12-15 reps or +20-40kgx1 ▪ Push-ups 20-25 reps with +15kg ▪ Dip 30-50kg x1 rep ▪ Muscle Up BW x1-3
Medium	▪ PullUp 40-70kg x1 ▪ Dip 50-100kg x1 ▪ Muscle Up 10-20kg x1
Advanced	▪ PullUp 70-100kg x1 ▪ Dip 100-150kg x1 ▪ Muscle Up 20-40kg x1
Ultra-advanced	▪ PullUp 100-120kg and abovex1 ▪ Dip 150-195kg and above x1 ▪ Muscle Up 40-70kg and more

This table may have nothing to do with objective reality. For some people these standards may be overstated and for others are underestimated. Even official strength sportsfederations can issue subjective norms.

ABOUT THE PROGRAM

The intermediate level means that you have exhausted the potential of entry-level program. It is no longer sufficient for you to
of that workload, so other methods of progression will be included in the work.
The program will be divided into 2 phases:

1. Volume cycle
2. Intensive cycle

At this stage, progress will go
The longest, or rather the program itself will not exhaust itself quickly, because the progression of the loads, i.e. the increase in intensity will be less frequent by a factor of 2 -the weights will increase once every 2 weeks.This level of training requires more effort thanat entry level. You need to remove all stress factors that can hinder your progress! Now you can show a good level and even perform at city or regional competitions! But to achieve incredible results, you will have to work harder than the rest. In fact, that is why I have writtenthis program for you.
I've also added 2 points to the program, in which I've worked out how to do warm-up approaches and how to do the 1RM walk-through correctly.
Arm yourselves with the theory and let's go!

INVENTORY

1. Bar for Pull-up and Bar for Dip (bars for dip 5-10 cm wider than shoulders)
2. Additional weighting in the form of thinweights for entry level minimum 60kg: 15kg - 2 pcs. and 10kg - 2 pcs. and small pancakes 5kg, 2.5kg, 1.25kg and 0.5kg - 2 pcs. each.
3. Belt, carabiners and rope (or chain) tohang extras on weight bearing.
4. Training rubber loops for warming up.

BASIC CONCEPTS

BW - Bodyweight, own weight (pull-ups with bodyweight).

3x6 - Approaches X Repetitions

The reserve - is the number of repetitions you couldstill do after made a plan approach. Determined by how you feel. For example, if you have done **6** repetitions but feel that you would **2** more repetitions, then the reserve will be **2** repetitions.

Volume - is the number of sets and reps per workout, week or month

Intensity - is the load you endure during the exercise. (addingextra weight, making exercises more difficult, increasing speed of execution)

Unloading - is the reduction of the working weight by 5-10 kg. Necessary when progression has set in.

WARM-UP

A good warm-up takes only 10-15 minutes and is necessary to prepare your body for thework ahead and to reduce the likelihood of injury. The warm-up will bedivided into 3 stages:

1. At the beginning of the warm-up, perform5 minutes of cardio to get your heart rate up. Jumping rope or without, light jogging, running in place or a brisk walk to the gym. This will be a warm-up for your heart.
2. This is followed by a joint warm-up of all parts

of the body, which are the neck, shoulders, elbows and hands,

back, pelvis, knees and feet. 10-15 strokes or rotations for each part of the body.

3. Afterwards, you should do a warm-up before the main pull-up and push-up movements.
   Back pulls and pectoralisers are good for this.One to two sets of 10-15 repetitions with anelastic band is sufficient.
   Between all three warm-up phases
   Rest for 20-40 seconds according to how you feel.

WARM-UP BEFORE WEIGHTS

Warm-up approaches should be performed when your working weights are getting bigger and bigger, it is necessary to warm up your CNS before working weights and to prepare your musculoskeletal system for high loads. You should not climb to big weights right away after a simple joint warm-up. The first warm-up approach will be with CB. Before working weight you must perform 2-5 sets where each consecutive set will be heavier than the previous one. Number of reps in one warm-up load will be the same as in the work load.

Weight\set	1	2	3	4	5	6
0-50kg	BW 3-8	33%	66%	Work	Work	Work
50-100kg	BW 3-8	25%	50%	75%	Work	Work
100-150kg	BW 3-8	20%	40%	60%	80%	Work

If your work approach is 90x5, it is best towarm up in this order: BWx5, 25x5, 50x5, 70x5 and then work approach 90x5

On small scales from 0 to 30kg you can Do 1 warm-up with 50% of the working weights. All reps of the warm-up sets mustbe do in explosive and speedy technique!

PROGRAMME - TWO PHASES
1. VOLYMETRIC CYCLE

Exercise	Monday	Wednesday	Friday
1 week Pull-Ups	+weight **(volumetric)** **3 x 5-6**	+weight (light) 2 x 4	**(heavy)** **3 x 3**
2 week Dips	(light) 2 x 5	**(maximum)** **1 x MAX** (weight from 3x3)	(light) 2 x 6

LOAD PROGRESSION				
Reps	6	5	4	3
How much add	2.5	1.25	0.5	Not add

This cycle stretches over 2 weeks, so the progression of the weights, i.e. increasing the weights, takes place once every 2 weeks. This gives the program a longerprogression.

<u>In the first</u> week you work out the whole training volume, the main working weights are worked out on Friday 3x3, andon Monday you do

3 x 5-6 with a weight that is 10kg less than the weight of the 3x3 on Friday. In between is one light 2x5 workout on Wednesday.

The starting weight for the 3x3 layout in this program should be the same as the weight you used at the end of the last phase entry level, but with 5-10kg less weight, it is better to start the cycle with a reserve. Either it will be 60-70% of your One-Round Maximum with Maximum Weight.

In the second week, on Wednesday, you test for maximum reps the weight with who did the 3x3 the previous week. Mondayand Friday are worth the same light 2x5 and 2x6 workouts.

The progression of loads depends on specifically from Wednesday's 1xMAX workout, the more reps you do in one bout, the more weight you can put on in the next 2-week bout cycle. The progression itself is written inthe table above under the program.

Before you start training on the program, on light training you take 60-70% of the working weights on 3x3 and 1xMAX.

Progression of weights on the lungs training is the same as in basic training -how much was added on
the main ones, so much you add on the lungs.

It is in these training sessions that you practise your technique and, if I may say so,"bleed" for more
rapid recovery before
the next main training session. These toning workouts won't seem easy after themain workouts, you probably won't recover100%, but with 2 x 4-6 you'll manage without any problems.
If you for some reason do not
do all the repetitions as planned, e.g. youhave not recovered to end, then 1 extra day's rest should be givenbefore the next training. Otherwise, if you do not performas planned several training in a row, then the best
the decision will be to move on to the next phase of the Intensive cycle.

I would also like to point out that the record the second week's training is not heavy or extensive, it is just

checking your repetition maximum in one approach. Yes, this one The only approach may tire you out a littledue to the fact that you are maxing it out, but overall it won't hit you hard or make recovery more difficult before the next cycle.

It's okay if you sometimes do less than 6 reps on record workouts (4-5 reps), just add a little less weight in the next cycle. Then the number of reps is likely to increase to 6 again and the progress will last for some more time. If you got to such weight that you can't do 6 reps on a record workout, then do 5 reps, but in any case do not add 2.5 kg every cycle, go for 1.25 kg every cycle, slowly but surely, do not hurry.

You should treat this program with maximum seriousness, then it will give you its fruits in the form of progress and increasing the 1RM by several, or even a dozen, kilograms higher!

An example of your progress on record-breaking training will be the table at 4 weeks:

1 cycle		
MOND (volume)	Wednesday	FRIDAY **(heavy)**
Pull-Ups +50kg 3x6 Dips +70kg 3x6	Pull-Ups +40kg 2x5 Dips +60kg 2x5	Pull-Ups **+60kg** 3x3 Dips **+80kg** 3x3
MONDAY	WEDN **(record)**	FRIDAY
Pull-Ups +40kg 2x5 Dips +60kg 2x5	Pull-Ups **+60kg** 1x6 Dips **+80kg** 1x8	Pull-Ups +40kg 2x5 Dips +60kg 2x5
2 cycle		
MOND (volume)	Wednesday	FRIDAY **(heavy)**
Pull-Ups +2.5kg +52.5kg 3x6 Dips +2.5kg +72.5kg 3x6	Pull-Ups +2.5kg +42.5kg 2x5 Dips +2.5kg +62.5kg 2x5	Pull-Ups +2.5kg **+62.5kg** 3x3 Dips +2.5kg **+82.5kg** 3x3
MONDAY	WEDN **(record)**	FRIDAY
Pull-Ups +42.5kg 2x5 Dips +62.5kg 2x5	Pull-Ups **+62.5kg** 1x6 Dips **+82.5kg** 1x7	Pull-Ups +42.5kg 2x5 Dips +62.5kg 2x5

2. INTENSIVE CYCLE

Exercise	Monday	Wed	Friday
1 week Pull-Ups	+weight **(medium)** **6x1**	+weight (light) 2x4 +weight	**(heavy)** **4x2**
2 Week Dips	(light) 2x5	**(peak)** **3x3**	(light) 2x6

This phase will be a transition from intermediate to advanced level by reducing the number of reps in an approach and dramatically increasing the working weights. You can alternate Volumetric and Intensive cycles in different ways, e.g. 3-5 cycles you train on a volumetric cycle and 3-5 cycles on an Intensive cycle. You can also train on one of the cycles until you completely exhaust it and only then change the cycle to the other one.

The intensive cycle will also be stretched over 2 weeks, the weights will increase in

2 times less often than in the entry leveland between all main training sessions there will also be light training on technique, so the programme can be stretched much longer over the months ahead.

On the Intensive cycle you need to concentrate fully, not skip training and do not increase thenumber of rest days above two days. Too infrequent training will be will only make progress worse.

It is also worth removing all unnecessary exercises other than Muscle-Ups - these can be added at the end training after the basic movements.

As you can see, at the start of the week 2 The main training sessions are 6x1 and 4x2,and in the second week with the same weight you do a 3x3 peak workout.

On the first 6x1 workout you increasethe weight relative to the reserve of the last approach on the last 3x3 training. Next is the 4x2 workout, where the number of reps is higher by one, and the number of sets lower by two. This willbe an intermediate workout between the 5x1

and 3x3. The 3x3 workout tests your peak maximum, so to This training should be taken extremelyseriously!

As I wrote, weight gain by the next cycle depends on the severity extreme approach in a 3x3 training session,all depending on the reserves. See table:

Repetitions	3	3	2
Stock	1-2	0	0
How much add	2.5 - 5	0.5 - 1.25	unloading

The weight on the auxiliary training grows the same way as on the main training, i.e. once per cycle (2 weeks).
The initial weight to be chosen in the very first cycle will be the same as the last working weight of the Record cycle. It will be also possible to increase it by 2.5-5 kg.
Gradually this program will not work properly, weights are growing, the load on organism is very high, therefore the recovery will be longer than usually. Then it will be reasonable to replace this program by the advanced level program

WALK-THROUGH, CHECKING 1RM

At an intermediate level, you need to check your 1-repeat occasionally maximum. That's the whole point of Classic Streetlifting! But if you think broadly, you can set records not only in **1RM**, but also in **2RM**, **3RM** and higher! It all depends on your personal predisposition to workouts, with experience you will be more aware of your options. Wherever you want to go
If you want to set records, these program will help you do almost the full range of repetitions. From level to level, phase to phase, you increase the weights and decrease the number of repetitions. From high volumeto high intensity.

But still, how do you check your **1RM**?
How often should it be done?

The higher your level, the more often you can do **1RM** passes, so it is best for a beginner to do one pass before starting train according to a program. Based onthe result on the walk-through **1RM**, you line up the athlete's entire training process.

When the lifter is training in the 6-8 rep range, there is no point in doing 1RM, because the **1RM** will increase by a few pounds higher anyway without checking.

Later on, at an intermediate level, when the range of repetitions is reduced to 3-6 repetitions, a walk-through can be done once every 2-3 months, maybe even a little more often.

You can do passes at the advanced level much more frequently, but this will be explained in more detail in the programme itself.

The principle of **1RM is** very similar to the warm-up before working weights I wrote about earlier, only the number of repetitions is reduced by 1with each repetition after reaching 50% of the weight of **1RM** in anyof the sets. In fact, there is nothing as complicated as it may seem at first sight, but see the table below:

	Number of repetitions					
Approximate Range 1RM	**3-5**	**3-4**	**2**	**1**	**1**	**1**
0-50kg	BW	33%	66%	**1RM**		
50-100kg	BW	25%	50%	75%	**1RM**	
Range 1PM	**3-5**	**3-4**	**2-3**	**2**	**1**	**1**
100-150kg	BW	20%	40%	60%	80%	**1RM**

Here's an example. The approximate **1RM** of an athlete in pull-ups is 70kg. Then his warm-up on the walk-through willlook like this/

1. BW x 3-5
2. 20kg x 3
3. 40kg x 2
4. 55kg x 1
5. **1RM** approach 72.5kg x 1 (new record!)

Now let's assume that the lifter has a 1RM on the uneven bars of 130kg. His walkthrough would look like this:

1. BW x 3-5
2. 25kg x 3
3. 50kg x 3
4. 75kg x 3
5. 100kg x 2
6. 115kg x 1
7. **1RM** 132.5kg x 1 (new record!)

I also recommend resting at least 2 days after or before the main workout with working weights. I especially advise against doing a walk-through immediately after the main workout training or the next day. Take the **1RM** seriously, as it counts as a full workout for your **High Threshold Motor Units**! But you will find out more about this in the Advanced Level program!

F.A.Q - ANSWERS TO QUESTIONS

1. How much training for each phase? As long as you can squeeze the maximum out of them! Everyone will have a different duration, depending on genetics, age and recovery between training.

2. What results can be expected from this program?

Doing it right will definitely surprise you with the results, but roughly speaking:

Pull-Ups: 80 to 100kg x1 rep or more!

Dips: 120kg to 150kg x1 rep and over!

3. How much rest do I need between each approach?

5 to 7 minutes, but after heavy sets you can rest for up to 8-12 minutes. Rest for as long as you need, take your time!

4. What exercises can be added to the program?

Only exercises for the abs.

At this stage it is worth removing anything unnecessary, especially squats with extra weight.

5. How many pull-ups and push-ups will I do without weight with this program?

The number of repetitions will definitely increase in 1.5 to 2 repetitions, maybe more! Pull-Ups 25 to 35 repetitions, Dips 50 to 70 repetitions.

STRETCH

We don't need a bunch of variations to stretch in, just the one below:

1. Hang on the bar with both hands or on one hand, depending on your level.
   (Stretches the back muscles, abs, pecs)
2. Hold the bottom position on the uneven bars at full stretch.
   (stretches pecs, triceps, shoulder girdle)
3. Reverse hanging on the bar.
4. Plank on straight arms with a bend, touching the floor with your belly.
   (Stretches the front part of the body, i.e. the abs)

Do 2-3 approaches of 30-40 seconds at the end of your workout.

NOURISHMENT AND SLEEP

There are basic principles
recover from your training! Eat right and get enough sleep, and your progress will take off likea bird in the sky! To be more specific, it's a good idea to start by adjusting your diet, i.e. removing The national rubbish: cakes, biscuits, sodas, Snickers, sweets, chocolates and so on. These can be eaten, but preferably very infrequently.
The next thing to do is to get rid of
bad habits, stop drinking alcohol and smoking cigarettes.
Firstly - it will slow down your progress in training, and secondly, it will be even more detrimental when combined with training
Between training sessions, you need to give nutrition
your body as much as possible, eat lots of slowand fast carbohydrates, and
proteins and fats. Fast carbohydrates include fruit, such as apples and bananas, dried fruit like sultanas and dates, or
Pastries in the form of marshmallows, marshmallows or marmalade. Slow carbohydrates include pasta, oatmeal, rice, buckwheat, millet and similar cereals. A protein-fat meal is desirable after training. This can be done with any kind of whole meat or
meat cutlets, eggs and pulses in the form of peas. Butter and nuts can be consumed along with these; these will be sources of fats.
The most important thing in your diet is to avoid combining proteins and

I do not recommend combining fats with carbohydrates, i.e. follow the Separate Dietary Guidelines, especially do not combinefats and carbohydrates.
This is done to eat much more than usual to increase the daily allowance
calorie allowances. Protein and carbohydrates are also best eaten separately, so that proteins are digested quickly and without putrefaction. Protein is best combined with fibre, and vegetables will serve as this. I strongly recommend a separate diet and a deficit calories for those athletes who are overweight. Also, train hard, increase your daily activity and look in the mirror more often, as the scale doesn't give you full information on your body recomposition. (Body recomposition is the simultaneous burning of fat and gaining muscle mass). Take at least 10k steps a day, get a good night's sleep and don't
Eat your stress with all sorts of crap.

I won't tell you anything new about **sleep** either:

1. A minimum of eight to nine hours of sleep.
2. Ventilate the room before going to bed.
3. Sleep in complete darkness and silence.
4. Don't eat or drink an hour before bedtime.
5. Turn off all gadgets and lights an hour before bedtime.
6. Improve the sleeping place: buy a more comfortable pillow and mattress.
7. Don't set a loud alarm clock to
   the body is not under stress. It is better towake up without an alarm clock at all.

Thank you for purchasing this program! I hope you will start your training journey withthis program, as I used a similar progression method with rubber myself a long time ago. The load in this program is themost optimal, you can adjust yourself
it to your liking. Have fun training andprogress!

Regards, your mentor Andrei Pakin
