TABLE OF LEVELS

Level	Approximate level data
Zero	▪ PullUps BW 0-5 reps ▪ Push-ups BW 0-10 reps
Beginner	▪ Pullups BW 12-15 reps or +20-40kgx1 ▪ Push-ups 20-25 reps with +15kg ▪ Dip 30-50kg x1 rep ▪ Muscle Up BW x1-3
Medium	▪ PullUp 40-70kg x1 ▪ Dip 50-100kg x1 ▪ Muscle Up 10-20kg x1
Advanced	▪ PullUp 70-100kg x1 ▪ Dip 100-150kg x1 ▪ Muscle Up 20-40kg x1
Ultra-advanced	▪ PullUp 100-120kg and abovex1 ▪ Dip 150-195kg and above x1 ▪ Muscle Up 40-70kg and more

This table may have nothing to do with objectivereality. For some people these standards may be overstated and for others are underestimated. Even official strength sportsfederations can issue subjective norms.

ABOUT THE PROGRAM

The Advanced Level program is only for athletes who have a high one-repetition strength score.

Now your task is to implement all of the past training volume you have built up over a year into a high intensity, close to the One-Return Maximum (1RM).

The number of reps in one attempt is reduced to a range of 1 to 3, but the weights are increased dramatically. Therefore, it is necessary to perform all reps in such workouts at maximum speed because long time under load will be bad for recovery before the next workout. This approach trains the CNS and High Threshold Muscular Units (HCTU) - they are the ones responsible for the maximum effort of all muscle fibers of the body. This program is also suitable for pre-competition training, but it must be adapted specifically before the competition.

The program will be divided into 2 phases:

1. Realization cycle
2. Discharge cycle

Also I added 2 points to the program, where I analyzed: how to correctly do warm-up approaches and how to correctly do 1RM.

Arm yourselves with all the theory and let's go!

INVENTORY

1. Bar for Pull-up and Bar for Dip (bars for dip 5-10 cm wider than shoulders)
2. Additional weighting in the form of thinweights for entry level minimum 60kg: 15kg - 2 pcs. and 10kg - 2 pcs. and small pancakes 5kg, 2.5kg, 1.25kg and 0.5kg - 2 pcs. each.
3. Belt, carabiners and rope (or chain) tohang extras on weight bearing.
4. Training rubber loops for warming up.

BASIC CONCEPTS

BW - Bodyweight, own weight (pull-ups with bodyweight).

50 3x6 – Weight X Approaches X Repetitions

The reserve - is the number of repetitions you couldstill do after made a plan approach. Determined by how you feel. For example, if you have done **6** repetitions but feel that you would **2** more repetitions, then the reserve will be **2** repetitions.

Volume - is the number of sets and reps per workout, week or month

Intensity - is the load you endure during the exercise. (addingextra weight, making exercises more difficult, increasing speed of execution)

Unloading - is the reduction of the working weight by 5-10 kg. Necessary when progression has set in.

WARM-UP

A good warm-up takes only 10-15 minutes and is necessary to prepare your body for thework ahead and to reduce the likelihood of injury. The warm-up will be divided into 3 stages:

1. At the beginning of the warm-up, perform 5 minutes of cardio to get your heart rate up. Jumping rope or not, light jogging, running inplace or a brisk walk to the gym. This will be awarm-up for your heart.
2. This is followed by a joint warm-up of all

parts of the body, which are the neck, shoulders, elbows and hands, back, pelvis, knees and feet. 10-15 strokes or rotations for each part of the body.

3. Afterwards, you should do a warm-upbefore the main pull-up and push-up movements.
   Back pulls and pectoralisers are good for this. One to two sets of 10-15 repetitions with anelastic band is sufficient.
   Between all three warm-up phases
   Rest for 20-40 seconds according to how you feel.

WARM-UP BEFORE WEIGHTS

Warm-up approaches should be performed when your working weights are getting bigger and bigger, it is necessary to warm up your CNS before working weights and to prepare your musculoskeletal system for high loads. You should not climb to big weights right away after a simple joint warm-up. The first warm-up approach will be with BW. Before working weight you must perform 2-5 sets where each consecutive set will be heavier than the previous one. Number of reps in one warm-up load will be the same as in the work load.

Weight\ set	1	2	3	4	5	6
0-50kg	BW 3-8	33%	66%	Work	Work	Work
50-100kg	BW 3-8	25%	50%	75%	Work	Work
100-150kg	BW 3-8	20%	40%	60%	80%	Work

If your work approach is 90x2, it's best to warm up in this order: CBx5, 25x3, 50x3, 70x2 and
then a 90x2 working approach.
At small weights from 15 to 50 kg you can do1-2 warm-up sets with 40-50% of the working weights (muscle ups).
All repetitions of warm-up sets must be done in a fast technique!

PROGRAM - TWO PHASES
1. REALIZATION CYCLE

*The weights shown in the table are for an example of how to structure your workout.

Exercise /week	Monday (heavy)	Wedn (pauses)	Friday (heavy)
1 week Pull-Ups	+add weight *70 2x3 80 2x2 90 2x1	+add weight 60 3x3 70 3x1	70 3x2 80 2x2 92.5 2x1 (+2.5kg in 2x1)
Exercise /week	Monday (breaks)	Wedn **(1RM)**	Friday (breaks)
2 week Dips	60 1x4 70 1x2	1RM (93.75 - 97.5kg)	60 2x3 70 2x1

LOADING PROGRESSION				
How many kgdid you add in 1RM?	5	2.5	1.25	0.5
How much to add in working weights?	2.5	1.25	0.5	**Not Add**

As previously stated, the basis in this program is based on approaches with minimum repetition and maximum weight, i.e. 2x1 on Mon and Fri, and a pass to 1RM on Wed the following week. Also, as in the early

we are left with the lungs training between all main training sessions,varying only the number of sets and reps.

The best starting weight would be90% of 1RM - this would be the starting weight in a 2x1 layout, so that a walkthrough to determine the 1PM must be done 2 days before the start of the givencycle. Then from this value 5-15kg is taken away - this will be a 2x2. Taking away another 5-10kg would be weight in a 2x3 layout. Taking 100kg in 1RMas an example, the working weight in 2x1 will be 90kg, followed by 80kg in 2x2 and 70kg in 2x3. This will be the first cycle workout. The second workout will be 60 3x3 for 10kg less than 70kg 2x3 and also70 3x1. Same for the rest of the light workouts, only they have slightly different approaches and reps!

Such arithmetic!

Explaining in words how the programmeworks is a challenge simple, so always look at the table and beguided by it!

Next we have a second heavy the first week's training on Friday, you do pretty much the same, but there are some changes: the first 70kg weights will not be 2x3, but 3x2, also in singles the weight will always be 1.25 or 2.5kg more than in Monday's singles.

The progression of the work weights will depend on how much you have increased your 1RM on Wednesday of the second week. This weight should be dividedby 2 and the resulting weight you add to thethe next cycle for all training. The progression is described in the tablebelow the program itself. It's as simple as that!

Progression of weights on the lungs training is the same as in basic training -how much was added on the main ones, so much you add on the lungs.

It is in these training sessions that you practise your technique and, if I may say so,"bleed" for more rapid recovery before the next main training session. These toning workouts will not seem easy afterthe main workouts, you are more likely not to

recuperate 100%, but you will definitely be able to cope with it without any problems.

If you for some reason do not

Do all the reps as planned, e.g. you have notfully recovered before training, then you should
give 1 extra day of rest before the nexttraining session. Otherwise
In case you do not complete several workouts in a row as planned, the best solution is to move on to the next phase -the Discharge (Unloading) Cycle(s).

I would like to point out that a runup to 1RM in week 2 is not hard or voluminous, it's just a test of your One-Time-Maximum in one approach. Yes, this one a single approach may tire you out a bit dueto the fact that you are doing this approach with maximum weight, but in You won't suffer much from it and it won't make recovery before the next cycle moredifficult.
It is all right if you occasionally do a little less weight on the pass up to 1RM, just add a little less weight in the nextcycle.

An example of your training would bethe tables below:

1 cycle - at 1RM it was 95kg and 125kg		
MONDAY (heavy)	WEDN (pauses)	FRIDAY (heavy)
Pull-Ups +70кг 2x3 +80кг 2x2 +90кг 2x1 Dips +100кг 2x3 +110кг 2x2 +120кг 2x1	Pull-Ups +60кг 3x3 +70кг 3x1 Dips +90кг 3x3 +100кг 3x1	Pull-Ups +70кг 3x2 +80кг 2x2 +92.5кг 2x1 Dips +100кг 3x2 +110кг 2x2 +122.5кг 2x1
MONDAY (pauses)	MONDAY (pauses)	MONDAY (pauses)
Pull-Ups +60кг 1x4 +70кг 1x2 Dips +90кг 1x4 +100кг 1x2	Pull-Ups +100кг (+5кг) Dips +130кг (+5кг)	Pull-Ups +60кг 2x3 +70кг 2x1 Dips +90кг 2x3 +100кг 2x1

1 cycle - gain in working weights +2.5kg		
MONDAY (heavy)	WEDN (pauses)	FRIDAY (heavy)
Pull-Ups +72.5кг 2x3 +82.5кг 2x2 +92.5кг 2x1 Dips +102.5кг 2x3 +112.5кг 2x2 +122.5кг 2x1	Pull-Ups +62.5кг 3x3 +72.5кг 3x1 Dips +92.5кг 3x3 +102.5кг 3x1	Pull-Ups +72.5кг 2x3 +82.5кг 2x2 +95кг 2x1 Dips +102.5кг 2x3 +112.5кг 2x2 +125кг 2x1
MONDAY (pauses)	MONDAY (pauses)	MONDAY (pauses)
Pull-Ups +62.5кг 1x4 +72.5кг 1x2 Dips +92.5кг 1x4 +102.5кг 1x2	Pull-Ups +102.5кг (+2.5кг) Dips +132.5кг (+2.5кг)	Pull-Ups +62.5кг 2x3 +72.5кг 2x1 Dips +92.5кг 2x3 +102.5кг 2x1

2. DISCHARGE CYCLE

Exercise	Mon	Wed	Fri
1 week Pull-Ups and Dips	(grip change) 40% of 1RM 3x8	(pauses for 2 seconds) +5kg 3x7	(grip change) +2.5kg 3x6
2 Week Pull-Ups and Dips	(pauses for 3 seconds) +5kg 3x5	(grip change) +2.5kg 3x4	(pauses for 5 seconds) +5kg 3x3

This cycle should be inserted into your training process when the Realization cycle workouts become unbearable: you start to fail in your workouts, do not perform all approaches and reps as planned. Then unloading weeks should be included in the work. It is enough to insert such a cycle for complete recovery before the main Realization cycle. It is necessary to alternate both cycles purely intuitively, then, when it is necessary for you. For example, for 3-4 weeks you you train on the Basic Cycle, realise you're nottaking it out and immediately begin a discharge cycle consisting of light workouts with pauses and grip changes. Then after

this unloading cycle youstart the main cycle training again, but with an unloading for 5-10. This way you start the cycle all over again and progress easily again! 1 step back - 2 steps forward!

You can also include in your training as yougrow in strength schemes from the Intermediate level. Record training and the Intensive cyclealso can play the role of unloading week.

You can use the previous levels' program to your advantage! You don'thave to stay at the Advanced level only, you can also take 1 step back using the previous program and break into the Advanced level again - 2 steps forward!

WALK-THROUGH, CHECKING 1RM

The principle of **1RM is** very similar to the warm-up before working weights I wrote about earlier, only
the number of repetitions is reduced by 1with each repetition after reaching 50% of the weight of 1 PM in any ofthe sets. In fact, there is nothing as complicated as it may seem at first glance, but see the table below:

	Number of repetitions					
Approximate Range 1RM	**3-5**	**3**	**3-2**	**1**	**1**	**1**
0-50kg	BW	33%	66%	**1RM**		
50-100kg	BW	25%	50%	75%	**1RM**	
Range 1RM	**3-5**	**3**	**3**	**2**	**1**	**1**
100-150kg	BW	20%	40%	60%	80%	**1RM**

Here is an example. The lifter's approximate1RM on the Dip is 130 kg. Then his warm-up on the walk-through would be as follows:

1. BW x 3-5
2. 25kg x 3
3. 50kg x 3
4. 75kg x 3
5. 100kg x 2
6. 115kg x 1
7. **1RM** 132.5kg x 1 (new record!)

F.A.Q - ANSWERS TO QUESTIONS

1. How much training for each phase?

As long asyou can squeeze the maximum out of them! Everyone will have a different duration, depending on genetics, age and recovery between training.

2. What results can be expected from this program?

Doing it right will definitely surprise you with theresults, but roughly speaking:
Pull-Ups: 100 to 120kg 1 time or more!
Dips: 140 to 170kg 1 time and over!

3. How much rest do I need between each approach?

From 5 to 8 minutes, but after heavy sets you can rest for up to 8-12 minutes. Rest for as long as you need, take your time!

4. What exercises can be added to the program?

Only exercises for the abdominal muscles and Muscle Ups. At this stage it's worth removingeverything unnecessary, especially the squat with extra weight.

5. How many pull-ups and push-ups will I do without weight with this program?

The number of repetitions will definitely increase in 1.5 - 2 repetitions, maybe more! Pull-Ups 30 to 40 repetitions, Dips 60 to 80 repetitions.

STRETCH

We don't need a bunch of variations to stretchin, just the one below:

1. Hang on the bar with both hands or on one hand, depending on your level.
   (Stretches the back muscles, abs, pecs)
2. Hold the bottom position on the uneven bars at full stretch.
   (stretchespecs, triceps, shoulder girdle)
3. Reverse hanging on the bar.
4. Plank on straight arms with a bend,touching the floor with your belly. (Stretches the front part of the body,
   i.e. the abs)

Do 2-3 approaches of 30-40 seconds at the end of your workout.

NOURISHMENT AND SLEEP

There are basic principles
recover from your training! Eat right and get enough sleep, and your progress will take off like abird in the sky! To be more specific, it is a good ideato start by adjusting your diet, i.e. removing
The national rubbish: cakes, biscuits, sodas, Snickers, sweets, chocolates and so on. These canbe eaten, but preferably very infrequently. The next thing to do is to get rid of bad habits, stop drinking alcohol and smokingcigarettes. Firstly - it will slow down your progress in training, and secondly, it will be even more detrimental when combined with training Between training sessions, you need to givenutrition your body as much as possible, eat lots of slowand fast carbohydrates, and proteins and fats. Fast carbohydrates include fruit,such as apples and bananas, dried fruit like sultanas and dates, or Pastries in the form of marshmallows, marshmallows or marmalade. Slow carbohydrates include pasta, oatmeal, rice, buckwheat, millet andsimilar cereals. A protein-fat meal is desirable aftertraining. This can be done with any kind of whole meat or meat cutlets, eggs and pulses in the form of peas. Butter and nuts can also be consumed as sourcesof fat. The most important thing in your diet is to avoid combining proteins and

I do not recommend combining fats with carbohydrates, i.e. to follow the Separate

Dietary Guidelines, especially do not combinefats and carbohydrates.
This is done to eat much more than usual to increasethe daily allowance calorie allowances. Protein and carbohydrates arealso best eaten separately, so that proteins are digested quickly and without putrefaction. Protein is best combined with fibre, and vegetables will serve as this. I strongly recommend a separate diet and a deficit calories for those athletes who are overweight weight. Also, train hard, increase your daily activity andlook in the mirror more often, as the scale doesn't give you full information on your
body recomposition. (Body recomposition is the simultaneous burning of fat and gaining muscle mass). Take at least 10k steps a day, get a good night's sleep and don't
Eat your stress with all sorts of crap.

I won't tell you anything new about **sleep** either:

1. A minimum of eight to nine hours of sleep.
2. Ventilate the room before going to bed.
3. Sleep in complete darkness and silence.
4. Don't eat or drink an hour before bedtime.
5. Turn off all gadgets and lights an hour before bedtime.
6. Improve the sleeping place: buy a morecomfortable pillow and mattress.
7. Don't set a loud alarm clock to the body is not under stress. It is better to wakeup without an alarm clock at all.

Thank you for purchasing this program! I hope you will start your training journey withthis program, as I used a similar progression method with rubber myself a long time ago. The load in this program is the most optimal, you can adjust yourself it to your liking.
Good training and progress!

Regards, your mentor Andrei Pakin
